1. Determine the power of the signal given by the expression
 $f(t) = 10 \sin 5t \cdot \cos 10t$ [4 marks]

2. Sketch the signals (i) $f(t) = t^2 [u(t-6) - u(t-7)]$
(ii) $f(t) = (t-3)[u(t-4) - u(t-5)]$ [4 marks]

3. Find the convolution integral for the functions given by $f_1(t) = e^{-t}$ and $f_2(t) = \sin 3t$, for $t > 0$ [10 marks]

4. Find the impulse response across the capacitor voltage ($V_c(t)$) for the circuit shown in Figure.1, with unit step function as an input to the circuit. [8 marks]

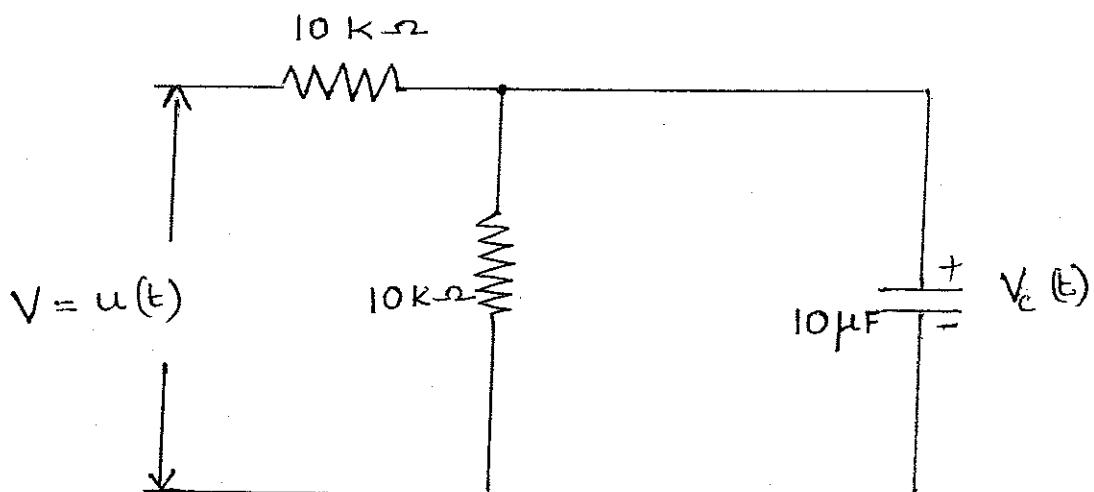

Figure.1

5. Find the Fourier transform of unit step function $u(t)$ [6 marks]
6. Find the zero-input component of the response, $y(t)$ for a LTIC system specified by the equation $(D^2 + 4D + 4) = Df(t)$ for $t \geq 0$, if the initial conditions are $y(0) = 3$ and $\frac{dy(0)}{dt} = -4$. [6 marks]
7. Transform the circuit shown in Figure 2 to its equivalent Laplace domain and obtain the expression for current $I_L(t)$. Assume initial energy stored in the circuit is zero. [10 marks]

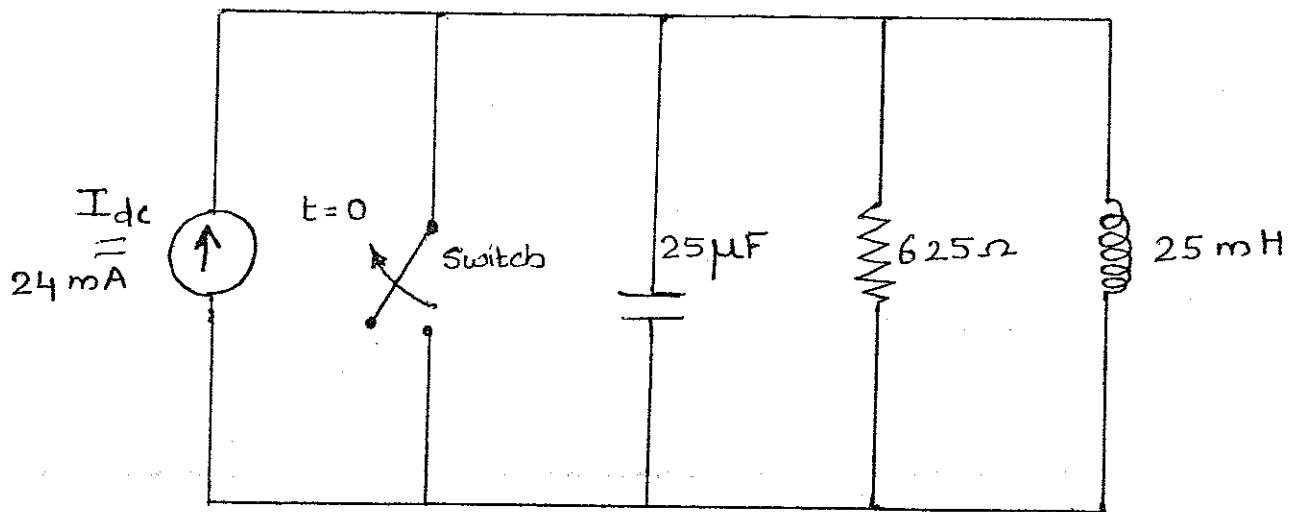

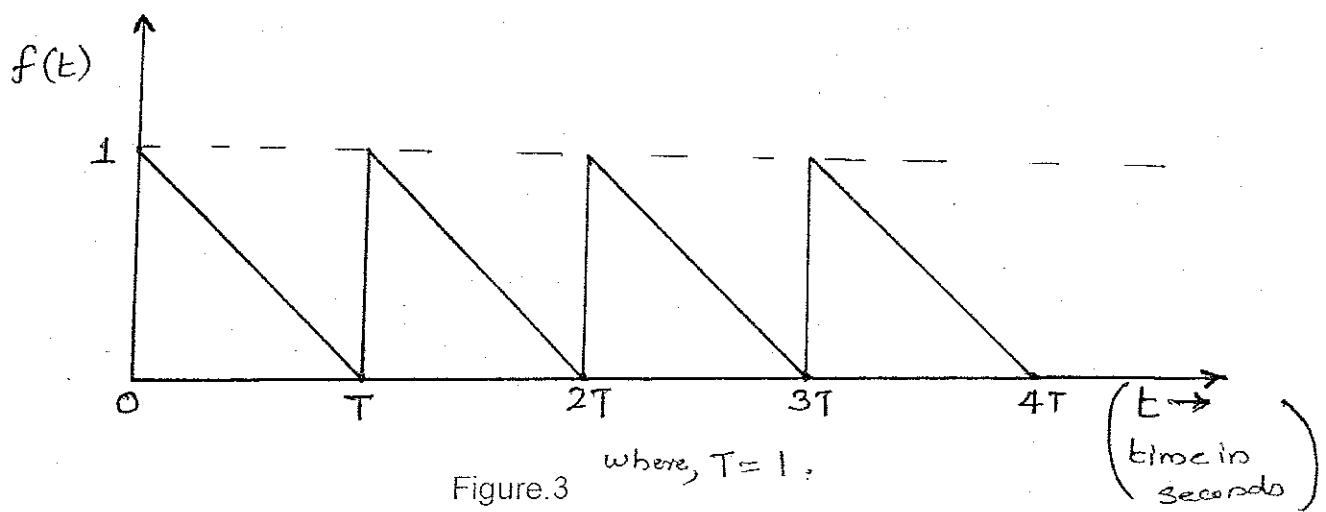

Figure.2

8. Find the inverse z-transform of $F[z] = \frac{z(2z^2 - 11z + 12)}{(z-1)(z-2)^3}$ [8 marks]

9. Find the Fourier series for the function given in Figure 3. [8 marks]

10. Obtain the canonical realization for the following transfer function:

a) $H(s) = \frac{4s - 28}{s^2 - 6s - 5}$ b) $H(s) = \frac{s - 5}{s + 7}$ [4 marks]

11. Find the inverse Laplace transform of $F(s) = \frac{s + 3 + 5e^{-2s}}{(s + 1)(s + 2)}$ [6 marks]

12. Write short notes on:

- a) Sampling Theorem
 - b) Butterworth and Chebychev Filters
 - c) Deterministic and Random signals
- [2+2+2 marks]

4]

To find impulse response we differentiate the step response.

$$\text{Step-} = u(t) = \begin{cases} 1 & t \geq 0 \\ 0 & t < 0 \end{cases}$$

~~Ans~~ $\frac{V - V_c}{10k} = \frac{V_c}{10k} + C \cdot \frac{dV_c}{dt}$

$\rightarrow [2 \text{ marks}]$

$$\frac{V - V_c}{10k} = \frac{V_c}{10k} + 10 \cdot \frac{dV_c}{dt}$$

$$\frac{V}{10k} = \frac{2V_c}{10k} + 10^5 \frac{dV_c}{dt}$$

$$\Rightarrow V = 2V_c + 10^5 \frac{dV_c}{dt}$$

$$\Rightarrow 10u(t) = 20V_c + \frac{dV_c}{dt}$$

As $u(t) \neq 1$

$$\frac{dV_c}{dt} = 10 - 20V_c$$

$$\Rightarrow \frac{dV_c}{10 - 20V_c} = dt$$

After integrating

$$\frac{\log(10 - 20V_c)}{20} = -t + C$$

$$10 - 20V_C = C \cdot e^{-20t} \rightarrow [2 \text{ marks}]$$

At $t=0$:

$$V_C(0) = 0$$

$$10 = C \cdot e^{-20 \times 0}$$

$$\Rightarrow C = 10$$

$$10 - 20V_C(t) = 10e^{-20t}$$

$$\Rightarrow V_C(t) = \frac{10 - 10e^{-20t}}{2} \text{ Volt}$$

$$\Rightarrow V_C(t) = \frac{1 - e^{-20t}}{2} \rightarrow [2 \text{ marks}]$$

The derivative of the step response give impulse response:

$$V_{S(t)} = \frac{dV_C(t)}{dt} = \frac{e^{-20t}}{2} \cdot 20 = \frac{10e^{-20t}}{2} \rightarrow [2 \text{ marks}]$$

5)

$$u(\omega) = \int_{-\infty}^{\infty} u(t) e^{-j\omega t} dt.$$

$$= \int_0^{\infty} e^{-j\omega t} dt = \left[-\frac{1}{j\omega} e^{-j\omega t} \right]_0^{\infty}$$

$$u(t) = \lim_{a \rightarrow 0} e^{-at} u(t)$$

$$u(\omega) = \lim_{a \rightarrow 0} F\left\{ e^{-at} u(t) \right\} = \lim_{a \rightarrow 0} \frac{1}{a+j\omega}$$

$$u(\omega) = \lim_{a \rightarrow 0} \left[\frac{a}{a^2+\omega^2} + j \cdot \frac{\omega}{a^2+\omega^2} \right]$$

$$= \lim_{a \rightarrow 0} \left[\frac{a}{a^2+\omega^2} \right] + \frac{1}{j\omega}$$

$$\int_{-\infty}^{\infty} \frac{a}{a^2+\omega^2} dw = \tan^{-1} \frac{\omega}{a} \Big|_{-\infty}^{\infty} = \pi$$

Thus $\underline{u(\omega)} = \pi \delta(\omega) + \frac{1}{j\omega} \rightarrow [6 \text{ MARK}]$

1. Using direct integration , find $e^{at} u(t) * e^{-bt} u(t)$ [4 M]

$$\begin{aligned}
 &= \int_0^t e^{a(t-\tau)} \cdot e^{-b\tau} d\tau \\
 &= \int_0^t e^{(at - a\tau - b\tau)} d\tau \\
 &= e^{at} \int_0^t e^{-(a+b)\tau} d\tau \\

 &= \frac{e^{at}}{a+b} \left[1 - e^{-(a+b)t} \right] \\
 &= \frac{e^{at} - e^{-bt}}{a+b}
 \end{aligned}$$

2. Find the Fourier transform for the signal shown below

[5 M]

$$\begin{aligned}
 F(\omega) &= \int_{-t_0}^{t_0} A \cdot e^{-j\omega t} dt \\
 &= A \cdot \left[\frac{e^{-j\omega t}}{-j\omega} \right] \Big|_{-t_0}^{t_0} \\
 &= A \cdot \frac{e^{-j\omega t_0} - e^{j\omega t_0}}{-j\omega} \\
 &= A \cdot \frac{\left[e^{j\omega t_0} - e^{-j\omega t_0} \right]}{j\omega} \\
 &= A \cdot t_0 \left[\frac{2 \sin \omega t_0}{\omega t_0} \right] \\
 &= \underline{\underline{A t_0 2 \sin c(\omega t_0)}}
 \end{aligned}$$

3. Find the Fourier series for the signal described by the function $f(t) = \cos(1000t)$
[4M]

$$f(t) = a_0 + \sum a_n \cos(n\omega_0 t) + b_n \sin(n\omega_0 t)$$

$$\begin{aligned} a_0 &= \frac{1}{T} \int_0^T \cos(1000t) dt \\ &= \frac{1}{1000T} \left[\sin 1000t \right]_0^T = 0 \end{aligned}$$

$$\begin{aligned} a_n &= \frac{2}{T} \int_0^T \cos(1000t) \cos(n\omega_0 t) dt \\ &= \frac{2}{2T} \int_0^T [\cos(1000t + n\omega_0 t) + \cos(1000t - n\omega_0 t)] dt \\ &= \textcircled{1} \quad \text{If } n\omega_0 = 1000 \quad \text{then } a_n = 1 \\ &\quad \text{if } n\omega_0 \neq 1000 \quad \text{then } a_n = 0. \end{aligned}$$

By inspection (or logically)

$$b_n = 0$$

"OR"

Alternative Answer :- As the given signal is originally a sinusoidal function, theoretically its Fourier Series should not exist
Hence, $a_{0,0}, a_n = 0, b_n = 0$

4. If $f(t) \leftrightarrow F(\omega)$, then $k f(t) \leftrightarrow k F(\omega)$ TRUE. (TRUE / FALSE)
[2 M]

*

$$a_n = \frac{1}{T} \left[\frac{\sin((1nw_0 + nw_0)T - 0)}{(1nw_0 + nw_0)} \right] + \frac{1}{T} \left[\frac{\sin((1000 - nw_0)T - 0)}{(1000 - nw_0)} \right]$$

At $n w_0 = 1000$, the value of a_n becomes:-

$$a_n = \frac{1}{T} \left[\frac{\sin(2nw_0 T)}{2nw_0} \right] +$$

$$+ \frac{1}{T} \left\{ \left[\frac{\sin 0}{0} \right] \text{from} \right\}$$

The second part of a_n is indeterminate form. Very L' Hospitals Theorem, we get

$$\lim_{\substack{n \rightarrow 0 \\ 1000 - nw_0 \rightarrow 0}} \left[\frac{\sin((1nw_0 + nw_0)T)}{1nw_0 + nw_0} \right] = a_{n_2} (\text{say})$$

$$a_{n_2} = \lim_{(1000 - nw_0) \rightarrow 0} \frac{1}{T} \left\{ 1 + \frac{\frac{d}{dw_1}(\sin w_1 T)}{w_1} \right\}$$

$$\text{where, } w_1 = \frac{1000 - nw_0}{nw_0}$$

$$\therefore a_{n_2} = \lim_{w_1 \rightarrow 0} \frac{1}{T} \left[\frac{(nw_1 T)T}{1} \right] = b \cdot \frac{1}{T} \left(\frac{(nw_0)T}{1} \right) (1)$$

$$\therefore a_n = \frac{1}{2nw_0 T} \sin 2nw_0 T + 1 = 0 + 1 = 1$$

$$\frac{dy(t)}{dt} + y^2(t) = f(t)$$

where $f(t)$ and $y(t)$ are the input and output to the system respectively. Prove that the system is non-linear. [4 M]

$$y_2(t) = \frac{d}{dt} y_2(t) + y_2^2(t) = f_2(t) \quad \text{--- (2)}$$

$$\frac{d}{dt} (k_1 y_1(t) + k_2 y_2(t)) + [k_1 y_1^2(t) + k_2 y_2^2(t)] =$$

$$k_1 f_1(t) + k_2 f_2(t)$$

because of square term the system is non-linear.
